

SystemStak™ Valves

ISO4401 Size 05

General Description

Eaton SystemStak™ valves make compact hydraulic systems in which modular valves are “sandwich” mounted between a directional valve and a standard mounting surface. Compact design improves system response by elimination of external fluid conductors, thereby resulting in elimination of resonant sounds which are noisy and lead to leakage. The design of these valves is well proven and offers opportunities for achieving small control assemblies, especially when the valves are used with multi-station manifolds.

Mounting surface is available for interfacing with directional valves and is coded “5” in the model numbers of Eaton SystemStak valves. The “5” interface accepts Eaton DG4S4 directional valves and other directional valves with a standard ISO 4401-05, NFPA-D05, ANSI/B93.7M size D05 or CETOP-5 port pattern.

Each valve “stak” can be configured to provide the specific combination of functions required to meet the system’s needs.

SystemStak valves are divided into two groups:

1. Valves acting in the pressure and/or tank lines (“P” and/or “T”)

DGMC	Relief valve
DGMDC	Direct check
DGMFN	Flow control
DGMR1	Sequence valve
DGMX2	Pressure reducing

The general rule for this group is that the DGMC relief valve be placed nearest the subplate or manifold. The DGMDC direct check valve should be placed nearest the directional control valve.

The DGMR1 sequence valve should be the farthest valve from the directional valve. The DGMR1 must be mounted directly to a subplate or manifold with a drain port, to externally drain the DGMR1 at the mounting face.

2. Valves acting in the service lines (“A” and/or “B”)

DGMC	Relief valve
DGMDC	Dual relief valve
DGMDC	Direct check
DGMPC	Pilot operated check
DGMFN	Flow control
DGMR	Counterbalance

The general rule for this group is that the DGMC system relief valve be the farthest valve from the directional valve.

When using a DGMPC with a DGMFN (meter-out), the DGMPC should be nearest the directional valve.

Features and Benefits

• Reduced space requirements

Stackable SystemStak valves, used with ISO 4401-05, CETOP 5 (NFPA-D05) directional controls, provide compact cost-effective control of actuator direction, speed and force.

• Reduced installed cost

SystemStak valves eliminate all intervalve piping and connections, thereby reducing the number of potential leakage points. Installed cost is less than when using conventional subplate- or line-mounted valves.

• Versatile & easy to install

SystemStak valves have all the internal passages necessary to serve the directional valve mounted above them. Any directional valve with a standard ISO 4401-05, NFPA-D05, ANSI/B93.7M size D05 or CETOP-5 port pattern can be used with ISO 4401-05 SystemStak valves.

Eaton bolt-extender kits simplify valve installation by permitting each valve body to be separately and quickly installed, and correctly torqued down. The kits also allow the directional valve to be removed for service or replacement without disturbing the stack.

• Rugged & reliable

Internal working parts are produced from hardened steel, and reside in a continuous-cast ductile (spheroidal graphite) iron body. Excellent reliability is ensured, even in high pressure applications. Working parts are serviceable without removing valves from the stack.

Easy to Understand, Easy to Design

SystemStak circuitry is best shown using slightly different symbols than those for traditional valve configurations. Each SystemStak symbol has the same basic form and size as shown in Figure 1.

Figure 1.

Figure 2.

For ease of understanding, remember the directions of flow for each line, and that all four flow paths pass through each valve (see Figure 2). For clarity, directional valves are drawn vertically in SystemStak circuit diagrams (see Figure 3.)

Figure 3.

Each station (valve stack) is a combination of functions. When designing and assembling SystemStak valves, care must be taken to ensure that they interact as required by stacking the functions in the correct sequence (see Figure 4). Direct check valves should be placed closest to the directional valve. Relief valves should normally be positioned next to the mounting surface (i.e. at the bottom of the stack). When both a flow control and a pilot operated check valve is required, it is recommended that the flow control valve be between the check valve and the actuator to prevent check valve chatter.

Figure 4.

A combination of directional valve, SystemStak valve(s) and subplate/ manifold block (Figure 5 single station subplate and Figure 6 multi station manifold) completes the assembly.

Figure 5.

Figure 6.

Figure 7 represents a complete SystemStak system, showing typical use of functions available from this range. The circuit diagram also shows the use of a tapping plate for accessing line pressure readings, and a blanking plate to close off an unused station of a multi-station manifold.

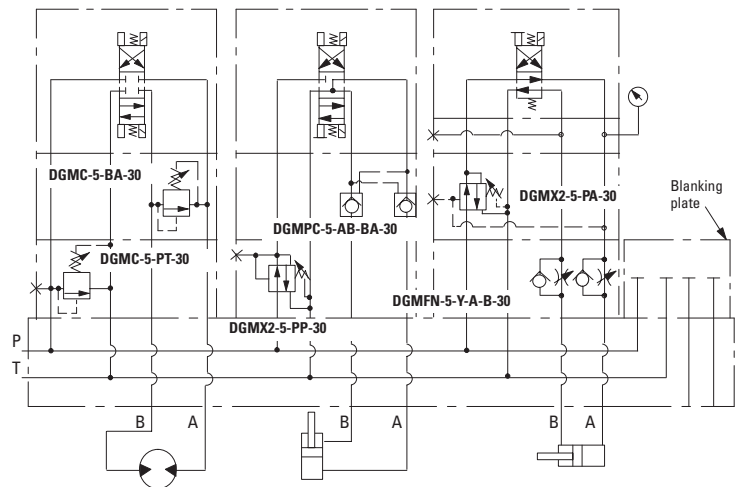

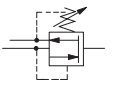

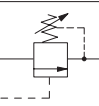

Figure 7.

Table of Contents

Function	Basic symbol	Basic model	Features	Page
Relief		DGMC/DCMC2	Single, dual and crossport models	5
Reducing/relieving		DGMX2	Piloted from (and reduced pressure in) port P, A or B	13
Sequence		DGMR1	Single port P sequence	17
Counterbalance		DGMR	Control in port T	20
Flow Control		DGMFN	Single or dual port, meter-in or meter-out	24
Pilot operated check		DGMPC	Single in port A or B; dual in ports A and B	29
Direct check		DGMDC	Single check in any port; dual check in ports A and B only	32

SystemStak™ Pilot Operated Relief Valves

DGMC/DGMC2

General Description

These two-stage valves limit system pressure by directing flow to tank or the opposite cylinder port (A-B/B-A crossport types) when system pressure reaches the valve setting.

Pressure control may be obtained in “A”, “B”, “A” and “B”, or “P” port, and pilot flow may be internally or externally drained, depending on model type. Any pressure in the line to which these valves are drained is additive to the valve pressure setting.

The valve pressure setting is adjustable by means of either an adjusting screw and locknut, a hand-knob adjuster, or a micrometer knob with keylock. External remote control/vent connections are available on all models except crossport relief. If required on crossport models, contact your Eaton representative.

Model Code

1 Valve function

Manifold or subplate mounted pressure relief valve.

2 Valve type

2 – Dual relief cavities

Blank – Single relief

3 Interface

5 – ISO 4401-AC-05-4-A, CETOP RP35H
ANSI/NFPA D05

4 Port operated upon

A – “A” cylinder port (single, dual or crossport types)

B – “B” cylinder port (single type only)

P – Pressure port (single type only)

5 Port drained into

A – “A” cylinder port

B – “B” cylinder port (crossport type only)

T – Tank port (single or dual types)

6 Pressure range

A – 4 to 50 bar (60 to 725 psi)

B – 4 to 100 bar (60 to 1450 psi)

F – 4 to 200 bar (60 to 2900 psi)

G – 4 to 315 bar (60 to 4500 psi)

7 Adjustment device

H – Knob adjuster

K – Micrometer knob with keylock

W – Screw with locknut

8 External drain

E – External drain

Omit for internal drain models.

9 P port acted upon

B – “B” cylinder port (dual or crossport type) Omit for single type.

10 Port drained into

A – “A” cylinder port (crossport type only)

T – Tank port (dual type only)

11 Pressure range

Omit for single type.

A – 4 to 50 bar (60 to 725 psi)

B – 4 to 100 bar (60 to 1450 psi)

F – 4 to 200 bar (60 to 2900 psi)

G – 4 to 315 bar (60 to 4500 psi)

12 Adjustment device

Omit for single relief models.

H – Knob adjuster

K – Micrometer knob with keylock

W – Screw with locknut

13 External drain

E – External drain same as position 8

Omit for single relief models.

14 Remote control port

RC – Remote control port

Not available on crossport models.

15 Gage port & thread type

Gage port for P-T models only; optional remote control (RC) and external drain (E) ports as applicable.

Omit for crossport models

B – G 1/8” (1/8” BSPF)

S – SAE-4 O-ring boss port
(0.4375-20 UNF-2B thread)

16 Design number - 30 series

Operating Data

Basic Characteristics

Maximum flow	120 l/min (32 USgpm)
Pilot flow@ 50°C (120°F) and 315 bar (4500 psi)	400–700 ml/min (24 in ³ /min-43 in ³ /min)
Maximum operating pressure	315 bar (4500 psi)ar (450 psi)
Pressure overshoot	31 bar (450 psi)
Operating temperature	-0° to 80°C (32° to 180°F)
Weights	DGMC 2,9 kg (6.5 lbs) DGMC2 3,6 kg (7.9 lbs)

Response time: For conditions of 5 liters (300 in³) of oil under compression and a flow rate of 120 l/min (32 USgpm) typical response is:

Initial pressure	Final pressure	Response time
17 bar (250 psi)	35 bar (500 psi)	95 ms
35 bar (500 psi)	140 bar (2000 psi)	110 ms
35 bar (500 psi)	315 bar (4500 psi)	150 ms

Performance Data

DGMC-5 and DGMC2-5 Insertion Loss

Insertion Loss

Total change in pressure drop from through ports "P" "B", "A" and "T" caused by the addition of the SystemStak valve to a hydraulic circuit. Insertion loss curves (see top left):

1. DGMC2-5-AT-**-(-E)-BT-**-(-E)-(RC)*-30

SystemStak™ Pressure Reducing/Relieving Valves

DGMX2

General Description

These two-stage spool valves maintain a reduced outlet pressure against variations in inlet pressure.

These valves are able to act as relief valves (at 50% of maximum flow) to prevent excess pressure being developed when an actuator is subject to a reactive load. Relief flow is directed to the "T_B" port. Therefore, for the relief function to operate, all components above this DGMX2 module must contain the "T_B" port, and the directional valve must have the "T_B" bypass feature.

Pilot control may be from the "P", "A", or "B" port. Pilot drain flow may be directed internally to tank port "TA", or externally out of the valve body.

Any pressure in the line to which these valves are drained is additive to the valve pressure setting.

The valve pressure setting is adjustable by means of either an adjusting screw containing an internal hex, a hand-adjust knob, or a micrometer knob with keylock.

Different spring ratings cover an overall pressure range from 2 to 315 bar (30-4500 psi).

The metering spool element in this design is always positioned in the "P" line (see symbols on page 14). The connection of the pilot control line determines at which port the reduced pressure is obtained. For example:

"PP" pilot for reduced pressure in "P" port

"PA" pilot for reduced pressure in "A" port

"PB" pilot for reduced pressure in "B" port

The "A" and "B" line models provide for reduced pressure when "P" is connected to "A" or "B". It allows free flow through the service port when connected to "T" (all via a four-way directional valve).

Model Code

Operating Data

Basic Characteristics

Maximum flow	120 l/min (32 USgpm)
Pilot flow @ 50°C (120°F) and 315 bar (4500 psi)	290–420 ml/min (18 in ³ /min-26 in ³ /min)
Maximum operating pressure	"A" models - 70 bar (1000 psi) * (inlet pressure) 50 bar (725 psi) (reduced pressure) "B", "F" & "G" models - 315 bar (4500 psi)
Leakage flow rate @ 50° C (120° F) and 315 bar (4500 psi)	80-200 ml/min (15-12 in ³ /min)
(Leakage to "Tb" around spool land @315 bar (4500 psi) Operating temperature -0° to 80°C (32° to 180°F)	
Weights	3,5 kg (7.7 lbs)

* Slightly higher pressure override characteristics between 70 bar (1000 psi) and 315 bar (4500 psi) inlet.

Performance Data

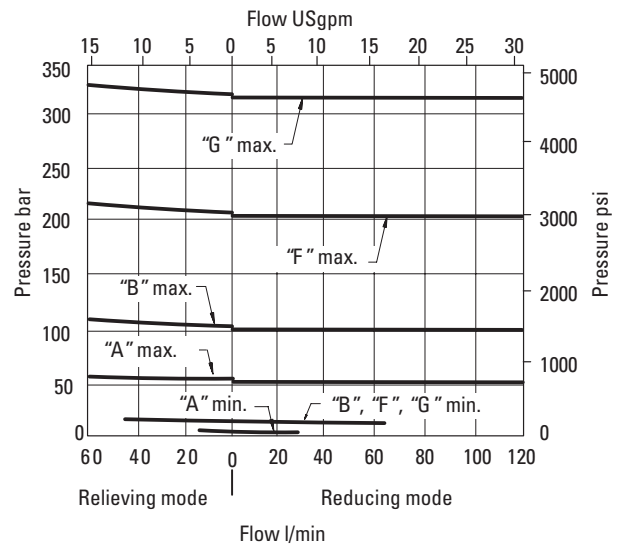

DGMX2 Insertion Losses

These curves show the typical pressure drop for each flow path in the valve. The "P" port pressure drop is the pressure drop for flow across the reducing valve spool in the fully open condition. The total insertion loss for the valve must be calculated by summing the losses through each of the four flow paths.

DGMX2 Pressure Override

These curves show the typical roll off or underdrive of the different pressure ranges at maximum settings. Also shown is the typical override of the relieving feature which prevents undesirable pressure rise in the reduced pressure port.

DGMX2 Minimum Reduced Pressure

The curves (left) show the minimum reduced pressure settings allowable for a given flow rate. The minimum pressure setting applies regardless of inlet pressure. Operation of the valve below minimum settings may cause erratic valve operation due to insufficient spring force to counter flow forces acting on the spool.

Installation Dimensions

DGMX2-5-PA/PB/PP Reducing/Relieving Valves

SystemStak™ Internal Pilot Operated Sequence Valves

DGMR1

General Description

These two-stage pressure operated valves are normally closed to flow through the main spool flow path. When system pressure reaches or exceeds the valve setting, the main spool flow path opens. Pilot flow may be externally or internally drained to tank.

Any pressure in the line to which these valves are drained is additive to the valve pressure setting.

The valve pressure setting is adjustable by means of either an adjustable screw containing an internal hex, a hand-adjust knob, or a micrometer knob with keylock. Different spring ratings cover an overall pressure range from 5 to 315 bar (75-4500 psi).

SystemStak™ Counterbalance Valves

DGMR

General Description

Eaton SystemStak counterbalance valves provide continuous protection from pump cavitation and prevent an actuator from running ahead of the pump supply.

These valves also provide thermal relief protection in closed systems.

NOTE

Counterbalance valves adjust in the opposite direction of other pressure control valves. Turning the adjuster counterclockwise increases the valve setting. Turning the adjustment clockwise lowers the pressure setting, releasing the load.

Drain

Any pressure in the line to which these valves are drained is additive to the valve pressure setting.

Pilot pressure Calculation

To open the counterbalance valve by remote control (referring to functional symbols below):

For 4:1 ratio (typically for cylinder load control), nominal pilot pressure at Port B =

$$\frac{\text{Cracking pressure} + (5 \times \text{Port } A_1 \text{ pressure}) - \text{Port A pressure}}{4}$$

For 10:1 ratio (typically for hydraulic motor control), nominal pilot pressure at Port B =

$$\frac{\text{Cracking pressure} + (11 \times \text{Port } A_1 \text{ pressure}) - \text{Port A pressure}}{10}$$

Model Code

SystemStak™ Flow Control Valves

DGMFN

General Description

These valves are adjustable, non-compensated flow restrictors. An integral check valve around the regulating orifice allows free flow in one direction and metered flow in the other.

Control is available in "A" only, "B" only, and "A" and "B" ports as an "X" type (meter-in) or "Y" type (meter-out).

The "P" port is available only in the "X" type (meter-in) and does not contain a reverse flow check.

The valve flow setting is adjustable by means of either a hex key adjusting screw and locknut, a hand-adjust knob, or a micrometer knob with keylock.

A normal or fine metering capability is available. See the pressure drop curves on page 26 for detailed performance difference.

DGMFN-5-Y-A**-30

DGMFN-5-Y-B**-30

Operating Data

Basic Characteristics

Maximum flow	120 l/min (32 USgpm)
Maximum operating pressure	315 bar (4500 psi)
Operating temperature	20° to 50°C (70° to 120°F)
Weights	3,1 kg (7 lbs)

Performance Data

Minimum Controlled Flow/No-Flow Leakage

Internal leakage will vary from valve to valve and with the pressure differential across the check. Approximate levels are:

Pressure Drop bar (psi)	Leakage* cc/min (in3/min)
50 (725)	160 (9.5)
100 (1450)	320 (19)
200 (2900)	640 (38)
315 (4500)	990 (60)

* Equals minimum controllable flow rate at the pressures stated.

Pressure Drop

The curves below show the pressure drop through individual flow passages. Curves labeled "metered flow/pressure drop" refer to the pressure drop through only the passage containing the flow control regulating orifice. Total valve insertion loss is a value derived from graph 1 or 2 plus the appropriate values of lines 1, 2 and 3 from graph 3.

Graph 1

Metered flow pressure drop.
Normal adjustment – "2"
models (see model code,
page 24).

Graph 2

Metered flow pressure drop.
Fine adjustment – "1"
models (see model code, page 24).

Graph 3

Free flow pressure drop across
check valve.

Graph 3

- 1 – "P" port of all models except DGMFN-5-X-P**-30
"B" and "T" ports of DGMFN-5-X-P**-30
- 2 – "T" port of all models except DGMFN-5-X-P**-30
"A" ports of DGMFN-5-X-P**-30
- 3 – Pressure drop across reverse free flow check valve

Note: "Turn" or "Turns" on curves in graphs 1 and 2, above, refer to turn of adjustment device from fully closed position.

N

SystemStak™ Pilot Operated Check Valves

DGMPC

General Description

These valves are single or dual check units. Dual check units have identical check elements located in the “A” and “B” cylinder port lines. The check valve poppets are moved into the open position by a central pilot control spool which moves toward one check or the other, depending on which port is pressurized.

The check valve located in the return circuit is opened by the operating pressure in the primary circuit. When the pressure in the pilot line is vented, the check valve will remain closed.

The pilot spool area to valve seat ratio is 3:1 on standard models, and 20:1 on models with the decompression feature.

Check valve cracking (opening) pressures of 1 bar (15 psi), 2,5 bar (36 psi) and 5 bar (73 psi) are available. Please note that back pressure on the downstream or free-flow side of the pilot check valve may prevent the valve from opening in certain situations. (Back pressure opposes pilot pressure trying to open the valve.) In such cases, pilot pressure required to open the decompression poppet and valve can be calculated as follows:

To open valve or poppet in line A:

$$\text{Pressure at } B_1 = \frac{P_A + P_C - P_{A1}}{\text{Area ratio factor}} + P_{A1}$$

To open valve or poppet in line B:

$$\text{Pressure at } A_1 = \frac{P_B + P_C - P_{B1}}{\text{Area ratio factor}} + P_{B1}$$

Where:

P_A = Pressure at A

P_C = Cracking pressure

P_{A1} = Pressure at A1

P_B = Pressure at B

P_{B1} = Pressure at B1

In the above cases, substitute cracking pressure and area ratio from the following:

Cracking pressure: 1, 2.5 or 5 bar according to model code position 6 (and position 10 for second function).

Area ratio factors:

Standard valve: 3

Decompression poppet: 20

Model Code

1 Valve function

Manifold or subplate mounted check valve.

2 Interface

5 – ISO 4401-AC-05-4-A, CETOP RP35H, Size 5 ANSI/NFPA D05

3 Decompression feature

D – With decompression feature
Blank – Standard (no decompression)

4 Check port

A – Check in cylinder port “A”
B – Check in cylinder port “B” (single check models only)

5 Pilot port

A – Pilot port controlling the “B” port check (single check models only)
B – Pilot port controlling the “A” port check

6 Cracking pressure

K – 1,0 bar (15 psi)
M – 2,5 bar (35 psi)
N – 5,0 bar (75 psi)

7 Decompression feature

D – Decompression feature
Blank – Standard (no decompression)
Omit for single check models.

8 Check port: second function

B – Check in cylinder port “B”
Omit for single check models.

9 Pilot port: second function

A – Pilot port controlling the “B” port check (dual check models only)
Omit for single check models.

10 Cracking pressure: second function

K – 1,0 bar (15 psi)
M – 2,5 bar (35 psi)
N – 5,0 bar (75 psi)
Omit for single check models.

SystemStak™ Direct Check Valves

DGMDC

General Description

These SystemStak valves are self-operating, spring loaded, poppet type single or dual check units.

Location of the check element can be in the "A", "B", "P" or "T" port.

A check in the "P" port is available as a "Y" single check model only.

A check in the "T" port is available as an "X" single check model only.

The dual check unit has identical check elements in both the "A" and "B" ports.

Check valve cracking (opening) pressures of 1 bar (15 psi), 2,5 bar (35 psi) and 5 bar (75 psi) are available.

Model Code

1 Valve function

Manifold or subplate mounted check valve.

2 Interface

5 – ISO 4401-AC-05-4-A, CETOP RP35H, Size 5 ANSI/NFPA D05

3 Direction of flow

X – Free flow from actuator (load)
Y – Free flow to actuator (load)

4 Check location

A – Check in cylinder port "A"
 ("Y" models only)
B – Check in cylinder port "B"
 ("Y" models only)
P – Check in pressure port "P"
 ("Y" models only)
T – Check in tank port "TA"
 ("X" models only)

5 Cracking pressure

K – 1,0 bar (15 psi)
M – 2,5 bar (35 psi)
N – 5,0 bar (75 psi)

6 Check location: second function

Omit for single check models.
B – Check in cylinder port "B"
 (dual check models only)

7 Cracking pressure: second function

Omit for single check models.
K – 1,0 bar (15 psi)
M – 2,5 bar (35 psi)
N – 5,0 bar (75 psi)

Adjustment of valve setting is only possible while key is inserted and turned to engage driving pin. When key is removed, adjuster knob can be freely spun and does not engage with setting mechanism.

DGMR

Mounting Surface

Dimensions mm (inches)

DGM****-5**

The "5" interface accepts Eaton DG4S4 directional valves and other directional valves with a standard ISO 4401-05, NFPA-D05, ANSI/B93.7M size D05 or CETOP-5 port pattern.

Bolt Extender Kits

ISO 4401-05 SystemStak valves may be mounted with either standard cap screws or bolt extender kits.

Metric cap screws must be of Class 12,9 (ISO 898) strength, minimum U.T.S. = 1200 MPa.

Inch threaded screws must conform to ANSI B18.3.

The use of Eaton bolt extenders simplifies installation by permitting each valve body to be separately installed with the correct torque value. A major advantage of bolt extenders is the ability to remove the directional valve for service or replacement without disturbing the stack assembly. There are 4 bolt extenders per kit.

SystemStak Valve Height		Metric	Inch	Extender Torque	
mm (inch)	Thread	Kit Model Number	Thread	Kit Model Number	
50 (1.97)	M6 x 1-6H	BKE-6M-50M	.2500-20 UNC	BKE-4-50M	11,3-14,7 Nm (100-130 lbf in)
60 (2.36)	M6 x 1-6H	BKE-6M-60M	.2500-20 UNC	BKE-4-60M	

Bolt extender cross section
